

Backup and Recovery from Xopero Software

Product Overview

Backup & Recovery with XOPERO

Simple backup. Dependable storage. Smart recovery.

Xopero Software is the leading producer of backup solutions in Europe, providing professional tools for comprehensive backup of critical business data.

Xopero customers belong to many different sectors: SMB, public administration, banking and finances, education, health care, telecommunications and IT.

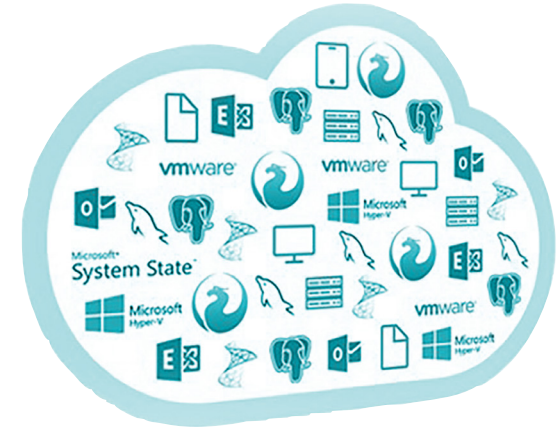

Through ESET Technology Alliance, the following Xopero solutions are available:

- Xopero Cloud
- Xopero QNAP Appliance
- Xopero Backup & Restore

Xopero Cloud

Xopero Cloud is a new generation of cloud backup solution that combines the enterprise security and fast recovery to keep your data safe and accessible no matter what.

Utilizing advanced cloud backup for computers, servers and virtual environments, Xopero delivers comprehensive protection for everything from a single laptop or smartphone through servers, databases, mailboxes and virtual machines.

Endpoint data protection	Xopero guarantees full protection against the loss of critical files and business documents stored on workstations and notebooks. The software ensures data recovery with no device downtime.
Server backup	In case of a breakdown, you can easily recover the system by making a backup copy of a Windows server. Xopero also allows you to back up and restore files, databases, email accounts, applications, programs, or virtual environments (MS SQL, MySQL, PostgreSQL, MS Exchange, MS Outlook, Firebird, Hyper V), network drives and the system state.
Easy to install	The installation process is simple and very fast. It takes just a few clicks to implement Xopero on any client's infrastructure.
Central/remote management	Xopero is equipped with the Management Center application, which provides the ability to comprehensively manage, remotely configure and monitor all processes of performed backup.
Fast & efficient	Expanded functions of the data sending process, such as deduplication, multi-thread operations, compression and delta backup, allow you to increase the speed and efficiency of the backup process and make adjustments appropriate for the needs of the company.
Bare metal recovery	Xopero allows fast recovery of the entire system environment—not only data, but system settings as well—on the old or new server.
Encrypted sync	Xopero's Briefcase feature enables encrypted synchronization and secure data collaboration. You can access the same set of protected documents securely from every device.
Versioning & retention	Users can easily go back to the previous version of a file. Thanks to the retention feature, they can also optimize storage space for data.
Data encryption	Encrypting files before sending with an unbreakable AES 256 algorithm, as well as the option to select an individual known only to the user encryption key, provides the highest level of data security and confidentiality.
Backup schedule	Users can easily determine the optimal time to run the backup process and the frequency with which it will be executed.

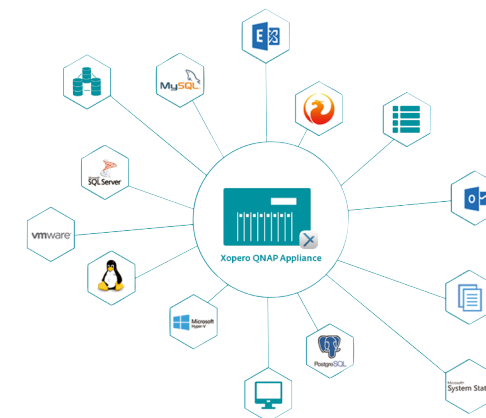

TECHNOLOGY ALLIANCE

ESET Technology Alliance aims to comprehensively protect businesses with a range of complementary IT security solutions. By combining our proven and trusted technology with other best-of-breed products, we provide customers with better options in the ever-changing security environment.

Xopero QNAP Appliance

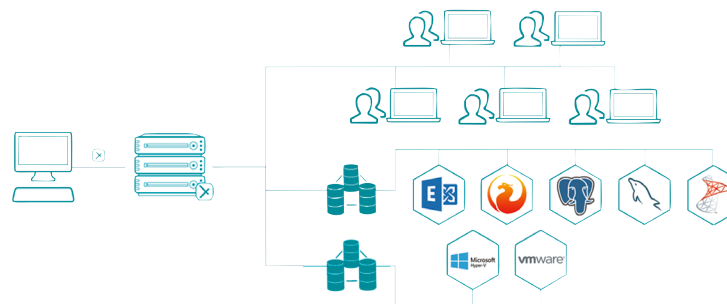

Disaster recovery & business continuity for QNAP NAS. The Xopero QNAP Appliance is a complete backup solution, which allows you to easily back up and restore files, databases, email accounts, virtual environments and system state. It allows you to manage your critical data, and monitor and remotely configure all the user accounts and applications installed on your company's devices.

Endpoint data protection	We generate hundreds of megabytes of crucial information every year. What's more important, business becomes mobile and a great amount of critical data is moved from data centers to endpoints. Xopero comprehensively protects all endpoint data created and stored on employee desktops, laptops, tablets or mobiles and guarantees simple data recovery and no downtime.
Server backup	In case of a breakdown, you can easily recover data from your physical environment. Xopero allows you to back up and restore files, databases (MS SQL, MySQL, PostgreSQL, Firebird), email accounts (MS Exchange and MS Outlook), applications, programs, network drives and the system state.
Virtual environment backup	With Xopero, you can easily secure all data from your virtual environment (Hyper-V and VMware). It automatically connects to your virtual server and displays all machines. Just select the one (or more) you want to back up and start protecting it.
Xopero smart recovery	Xopero's technology enables you to instantly launch virtualized mission-critical data with just a few clicks, using your QNAP server.
Bare metal recovery	Xopero allows fast recovery of the entire system environment—not only data, but system settings as well—on the old or new server.
Replication	Thanks to the site-to-site replication technology, you can create replicas of your data on another server. It's a great way to protect data from hardware failure, because it allows you to create replicas of your files on the new server in the original format. And it can be used directly on the destination site. Just continue your work from the moment the failure and data loss occurred.
Central management	The Management Center application gives you the ability to control application errors and warnings, and to check if all actions have been performed correctly. You get complete details on all backups performed on user accounts.
Simple restore and data migration	Xopero's comprehensive management center enables fast execution of migration processes. You can manage migration for multiple users and move data to existing or new devices.
Advanced encryption	AES 256 encryption guarantees that nobody can access your data. Backup files are protected in transit and after they're stored. You can also choose an individual encryption key, which provides the highest level of data security and confidentiality.

Xopero Backup & Restore

Xopero Backup & Restore is a centrally managed solution capable of running on any client's infrastructure. It allows you to easily and effectively create backups, synchronize and restore data from servers and workstations.

Endpoint data protection

We generate hundreds of megabytes of crucial information every year. What's more important, business becomes mobile and a great amount of critical data is moved from data centers to endpoints. Xopero comprehensively protects all endpoint data created and stored on employee desktops, laptops, tablets or mobiles and guarantees simple data recovery and no downtime.

Server backup

In case of a breakdown, you can easily recover data from your physical environment. Xopero allows you to back up and restore files, databases (MS SQL, MySQL, PostgreSQL, Firebird), email accounts (MS Exchange and MS Outlook), applications, programs, network drives and the system state.

Virtual environment backup

With Xopero, you can easily secure all data from your virtual environment (Hyper-V and VMware). It automatically connects to your virtual server and displays all machines. Just select the one (or more) you want to back up and start protecting it.

Fast & efficient

Expanded functions of the data sending process, such as deduplication, multi-thread operations, compression and delta backup, allow you to increase the speed and efficiency of the backup process and make adjustments appropriate for the needs of the company.

Bare metal recovery

Xopero allows fast recovery of the entire system environment—not only data, but system settings as well—on the old or new server.

Replication

Thanks to the site-to-site replication technology, you can create replicas of your data on another server. It's a great way to protect data from hardware failure, because it allows you to create replicas of your files on the new server in the original format. And it can be used directly on the destination site. Just continue your work from the moment the failure and data loss occurred.

Central Management

The Management Center application gives you the ability to control application errors and warnings, and to check if all actions have been performed correctly. You get complete details on all backups performed on user accounts.

Simple restore and data migration

Xopero's comprehensive management center enables fast execution of migration processes. You can manage migration for multiple users and move data to existing or new devices.

Advanced encryption

AES 256 encryption guarantees that nobody can access your data. Backup files are protected in transit and after they're stored. You can also choose an individual encryption key, which provides the highest level of data security and confidentiality.
